

What's New

EMC ApplicationXtender 6.0

EMC has released Version 6.0 of ApplicationXtender that adds two modules plus features for more effective document management and control.

Retention Manager is a module used for applying automatic retention capabilities such as holds, reporting, disposals and audits trails to documents to ensure regulatory compliance. Documents filed for retention cannot be modified or deleted from the repository until the specified retention period expires. Retention is enforced at a file level by ApplicationXtender's secure path feature.

The **Workflow Manager** module is used for creating departmental workflow solutions designed to improve efficiency in business processes. Built on Microsoft .NET, it provides out-of-the-box workflow samples, a user-friendly process designer and built-in reporting tools-everything business users need to design, implement and manage their processes without IT support.

Additional ApplicationXtender 6.0 enhancements include:

- Save the current page view as a new page version.
- Reorder pages within the document.
- Separate Documents - Copy or move all or select pages to a new batch in any AX application.
- Export values from a results set to a CSV file. This function was added to the ApplicationXtender Web Access .NET client.
- Display thumbnails in a contact sheet.

ApplicationXtender is a market-leading departmental document management solution that delivers rapid ROI for organizations with limited IT budgets and supporting resources. The solution provides out-of-the box capabilities that allow departments to manage content such as images, documents and reports. Built on a central repository, ApplicationXtender provides capabilities for high-speed image capture and storage and is designed for quick deployment.
